

Renewable Energy Society

renewableenergysociety.org.au

“One big difference between mining coal and other minerals such as copper or gold, is that coal inevitably comes with the potentially explosive methane gas.” from “Coal mining’s invisible killer” article: <http://www.theaustralian.com.au/news/features/coalminings-invisible-killer/story-e6frg6z6-1225957965701>

Renewable energy is important for progress of human race as non-renewable sources will eventually be running out. Coal pollutes the environment, creating greenhouse gases. Nuclear power puts the lives of surrounding residents at great risk. In an event of nuclear spill contamination can last for hundreds of years. In many big cities petrol fuelled vehicles emit dangerous toxic gases.

Today in countries such as Iceland, Tajikistan, Paraguay, Albania and Lesotho 100 % of all energy generated comes from renewable sources. However, in most countries the percentage of power generated from renewable sources is a lot less.

Most of the vehicles produced today are not electric powered. Unfortunately most motorists still prefer fuel powered cars and motorbikes that pollute the atmosphere.

The aim of Renewable Energy Society is to promote renewable energy generation and fund various renewable energy projects. Renewable energy will reduce greenhouse gases and fuel emissions.

Australia government encourages households and organisation install solar system by giving financial supports. Programs available include solar hot water program for households and National Solar Schools program.
